midnight_dev / field_notes / 001 · caduceus / v1.0 / 19_aug_2026

I “hired” my AI team against a personality test.

I built it. The assessment came back **Shaper** — least like an Implementer — so I cast five AI seats against my actual scores.

Three cover what I measurably lack. Two exist to argue with what I am measurably good at, because a 94th-percentile strength distorts a decision just as reliably as a weakness loses one.

counterweights a measured strength covers a measured gap unopposed — no seat assigned

version

v1.0

note

The first council it ever ran printed: "Treat unanimous councils with suspicion." Kept the line.

how_it_works

01 **Question filed**

It gets filed under a subject area, so the right track record applies.

02 **Everyone answers alone**

Every seat gets the same question at the same moment and writes without seeing anyone else.

03 **Names taken off**

Each seat then sees the others' answers with names and brands removed, and has to attack them.

04 **Unexplained flips flagged**

A seat that changes its mind without saying what changed it is named in the memo.

05 **Scored, never voted**

No show of hands. Each answer scores its seat's past record on this subject times how confident it said it was.

06 **Lead and dissent both print**

The top answer runs word for word, and the strongest disagreement runs beside it.

07 **You settle it**

When reality reports back you mark who was right. That grading is the only thing that moves a seat's standing.

the_outcome

It caught me about to ship a product with zero customers. I had decided against it forty minutes earlier. I did not notice. It did.

This is not a product you buy. It is a judgment system still trying to prove it should exist, on a timer. So the first move is a working session on your problem, not a contract.

book_a_working_session →

One operator. One settled outcome. A kill criterion still running. Nothing here claims proven ROI.
